**Brief description of the topic and the symposium dynamics**

This workshop will deal with the tension between uncertainty and opportunity from the point of view of philosophy of management. Uncertainty can be very dangerous in unstable technological systems and lead to crisis and destruction. Therefore, dealing with uncertainty may be the key to opportunity moving beyond destruction and collapse. Focusing on the tension between uncertain and opportunity in the perspective of philosophy of management, we will discuss the possible contribution to better performance of philosophy of management with a focus on the following:

1. Attention to the unforeseen. At the organizational level, this means that we have to be able to go beyond pre-given cognitive and moral interpretations of situations so that it is possible to make decisions in relation to the unforeseen.

2. Establish critical organizational identity. We can say that we need institutions with ethical integrity and stability.

3. Towards a decentralized view on corporate social responsibility. Instead of seeing the corporation or organization as being in the centre of the concern as affecting or being affected by stakeholders, we should see the organization as one among many stakeholders in complex systems.

4. Extending the scope of CSR including environmental responsibility. We need indeed to be aware of the critical function of sustainability for the aim and goal of organizations. Awareness of responsibility of the organization to its natural environment is essential for avoiding damage on to the environment.

5. Risk management becomes the central figure for sustainability. The organization should try to define and account for potential risks in relation to its activities. Risk management becomes the central figure for sustainability.

6. Tackling uncertainties of organizational action. We need to go beyond calculation and look at our responsibilities from a complexity perspective, and we need to go beyond the pre-established logic of quantitative and qualitative methods for analysis and try other methods for understanding and decision-making.
7. Go beyond binary logic to look into deep causality structures of events. Nevertheless, there are areas also the critical problems of the violent self-conservation and reproduction of the dialectical system that need to be taken into account when dealing with complexity.

8. In complex systems, we should be aware of interconnectedness and low-probability but high-impact extremes events.

9. Precaution and improved risk-mitigation. – Management should be critical to the information of predictions and be aware that risk is unavoidable in complex systems.
